ale často standardizujeme aj  $\begin{pmatrix} \mu \\ \sigma \end{pmatrix}$

tabuľka  
 $\downarrow$   
 divorce-std  $\sim$  marriage-std + Median Age Marriage-std  
 aby sa prirovnali na rovnakú škálu.

# Zatiaž

- Pozreli sme sa na dáta
- Standardizovali sme
- Špecifikovali sme model
- Zvili sme priory  $\alpha, \beta, \sigma$   
 a prior predictive check
- FIT MODELU ~~none~~ | with model, a...  
 b...  
 none)
- Posterior vizualizácia

a) Divorce rate  $\sim$  Median age model

b) Divorce rate  $\sim$  Marriage rate

takže zatiaľ máme 2 modely

$$1) Y_{STD} \sim N(\mu, \sigma) \quad \mu = \alpha + \beta_1 X_1 \text{ STD}$$

↳ median age Dartich

a

$$Y_{STD} \sim N(\mu, \sigma) \quad \mu = \alpha + \beta_2 X_2 \text{ STD}$$

↳ Dartich - STD

obe modely niečo ukasujú.

ale merieme či je medzi nimi correlation.

$X_1$  ovplyvňuje  $Y$ , ale  $X_2$  ovplyvňuje  $Y$ ,

ale  $X_1$  a  $X_2$  ovplyvňujú (ATD) veľak možností

ako zísť? **MULTIPLE** regression

$$D_i \sim N(\mu_i, \sigma)$$

$$\mu_i = \alpha + \underbrace{\beta_1 X_{1i}}_{\text{model 1}} + \underbrace{\beta_2 X_{2i}}_{\text{model 2}}$$

$$\alpha \sim N(0, 0.1)$$

$$\beta_1 \sim N(0, 0.5)$$

$$\beta_2 \sim N(0, 0.5)$$

$$\sigma \sim \text{exp}(1)$$

FIT model

↓  
RPM

$a$  = MedianAge\_marriage\_std  
 $M$  = Marriage\_std  
 $D$  = Divorce\_rate\_std

Sanity check (posterior, etc)

# Causality Analysis with the Posterior

$$D = \alpha + \beta \cdot M + \beta A$$

[22]: `print(rt.precis(m_5_3_idata.posterior)) # bookstyle`

| sample:        | 1000 values of 5 variables | mean  | sd   | 5.5%  | 94.5% | histogram |
|----------------|----------------------------|-------|------|-------|-------|-----------|
| $a = \alpha$   |                            | -0.00 | 0.10 | -0.16 | 0.17  |           |
| $bA = \beta A$ |                            | -0.60 | 0.16 | -0.85 | -0.35 |           |
| $bM = \beta M$ |                            | -0.06 | 0.16 | -0.30 | 0.20  |           |
| $\sigma$       |                            | 0.84  | 0.09 | 0.71  | 0.98  |           |
| $\mu$          |                            | -0.00 | 0.59 | -1.03 | 0.88  |           |

interval je celý  $neg. \sim -0.85, \dots -0.35$   
 Ak zvýšiš  $A$  (median age) o 1 a  $M$  rovnaké, znova v  $D$  je prave  
 ad zvýšiš  $M$  o 1, a  $A$  nedáš, tak  $D$  more (0.3, 0.9) more  
 $BA \rightarrow -0.6$   
 ad  $A$  ide hore,  
 $D$  ide dole!

[23]: `az.summary(m_5_3_idata, group="posterior", var_names=["a", "bM", "bA", "sigma"], kind="stats") # the same, arviz style`

|          | mean   | sd    | hdi_3% | hdi_97% |
|----------|--------|-------|--------|---------|
| $a$      | -0.000 | 0.103 | -0.184 | 0.207   |
| $bM$     | -0.060 | 0.158 | -0.347 | 0.257   |
| $bA$     | -0.605 | 0.157 | -0.898 | -0.312  |
| $\sigma$ | 0.837  | 0.088 | 0.678  | 0.998   |

model má dosť veľký odskok  $\sim 0.84 \Rightarrow 8\%$  nevyššie.  
 $-0.00 \rightarrow$  tak akurát sme diffund  
 Najkratší interval obsahuje 95% posterior.

Here we have a comparison of univariate and multivariate slopes for these predictors:

- In the multivariate model (`m_5_3`) the posterior rate for `bM` is close to zero, while `bA` is almost unchanged comparing to `m_5_1`.
- This indicates that the influence from `M` on `D` is minimal
- "Once we know median age at marriage for a State, there is little or no additional predictive power in also knowing the rate of marriage in that state."
- So  $D \perp\!\!\!\perp M \mid A$  holds and the second causal graph (with two edges) is more likely
- This is crazy: we used correlation analysis to decide something about causation! And purely based on data!

- a)  $D \sim A$   
 $bA$  je negatívne  $\Rightarrow$  vyšší vek po manželstve  $\Rightarrow$  nižší divorce rate
- b)  $D \sim M$   
 $bM$  je pozitívne, viac manželstiev  $\Rightarrow$  viac rozvodov.
- c)  $D \sim A + M$   
 $bA \rightarrow$  ostrá negatívne, aj keď bodový manželstiev rate  $\Rightarrow A$  silno súvisí s divorce rate  
 $bM \rightarrow$  okolo 0  $\rightarrow$  keď pozitívne  $A$ , marriage rate už nie neprirodzená

▷  
Dáva to zmysel. viac sobášov,  
viac rozvodov

NESÚVISY STYM

EE čím väčší ved  
týmne menší  
rozvodov

Ako zistiť čo pridáva M navyše?

**Residual plots**

▷ odstráni z (M) to čo je už v A, vie vysvetliť (A) a

pozrie či súvisí s (D)

1.) fit  $M \sim A \rightarrow \hat{M}$

2.) vypočítaj residuals  $M_{res} = M - \hat{M}$

3.) pozri či tieto residuals vedú k Divorce.

- ak  $M_{res}$  silno súvisí s D, tak M má pridať hodnôt aj po A  
ak nie, tak je zbytočné

Residuals for marriage rate (std) regressed on median age at marriage (std)

získaj časť (M) kt. A nevysvetľuje.

res plot  $M \sim A \rightarrow$  regrešiu na  $M$  na A

2.) added value M.  
reziduals

• FITNENIE REGRESIV  $\rightarrow$  otestovať či zvyšok Marriage rate (to čo A nevysvetľuje)

či je vysvetľuje divorce rate

Posterior predictive plot - Predicted divorce rate (and 89% HDI) vs observed divorced rate

## COUNTERFACTUALS

Zatiaľ máme model

$$D \sim A + M$$

→ vie rátať D ak máme dáta A, M

Counterfactual: ak zmením A, čo sa stane?

nĀn

chcen

keďže čo sa stane s M ak zmením A

(\* podľa nás, id dáť, by M nemalo ovplyvňovať D ale treba to posť.)

Fitted model:  $M \sim A$  → ak sa zmení M z A

```

with pm.Model() as m5_3_A:

    # mutable data nodes
    M = pm.Data("M", data.Marriage_std.values, dims = "marriage_obs_id")
    A = pm.Data("A", data.MedianAgeMarriage_std.values, dims="age_obs_id")
    D = pm.Data("D", data.Divorce_std.values, dims = "divorce_obs_id")

    # A -> D <- M
    sigma = pm.Exponential("sigma", 1)
    bA = pm.Normal("bA", 0, 0.5)
    bM = pm.Normal("bM", 0, 0.5)
    a = pm.Normal("a", 0, 0.2)

    mu = pm.Deterministic("mu", a + bA * A + bM * M)
    divorce = pm.Normal("divorce", mu, sigma, observed = D)

    # A -> M
    sigmaM = pm.Exponential("sigmaM", 1)
    bAM = pm.Normal("bAM", 0, 0.5)
    aM = pm.Normal("aM", 0, 0.2)

    muM = pm.Deterministic("muM", aM + bAM * A)
    marriage = pm.Normal("marriage", muM, sigmaM, observed = M)

    m5_3_A_idata = pm.sample(random_seed = rng)
  
```

Joint(casual) model for covul. Kombinuje 2 regression into 1

gem.  
model

$$D \sim A + B$$

$$a + bA + bM \quad / \sigma$$

$$M \sim A$$

$$aM + bAM \quad / \sigma_M$$

sigma ~ Exponential(f())  
bA ~ Normal(0, 0.5)  
bM ~ Normal(0, 0.5)  
a ~ Normal(0, 0.2)

sigmaM ~ Exponential(f())  
bAM ~ Normal(0, 0.5)  
aM ~ Normal(0, 0.2)

mu ~ Deterministic(f(bM, a, bA))  
muM ~ Deterministic(f(aM, bAM))

divorce ~ Normal(mu, sigma)  
marriage ~ Normal(muM, sigmaM)

$$\rightarrow D \sim N(\mu, \sigma)$$

$$\downarrow$$

$$M \sim N(\mu_M, \sigma_M)$$

↓ Counterfactual SIMULACIA

pre fitnuti modelu (nás máme práve pre praxu) nastavíme A na novgorotskú hodnotu a necháme model maximálne/predikovať aké M a následne D by vyšli

Keď umelo zvýšime A, tak model predikuje že D ide dole

výšší vek ⇒ nižší divorce

keď zvýšime A, model predikuje že M ide nižšie dole

výšší vek ⇒ nižší manžene role

## Masked relationship

-hidden effect: je vplyv medzi 2 premennými ale ho nevidíš.

napr.  $X_1$  + Hazi  $Y$  hore

$X_2$  + Hazi  $Y$  dole

ak id medzi dole tak  $Y$  sa bude veľmi líšiť

example: Zloženie mlieka v opíc.

Chceme zistiť aké "silné" je id mlieka (kcal per gram)

| $X_1 = M$ (maso) | $X_2 = N$ (neokortex v mozgu) % | $Y = K$ (kcal per gram) |
|------------------|---------------------------------|-------------------------|
| 1.95             | 55.16                           | 0.49                    |
| 5.25             | 64.54                           | 0.47                    |

1.) Standardize + drop empty rows

| M     | N     | K     |
|-------|-------|-------|
| -0.52 | -2.11 | -0.95 |
| -0.38 | -0.54 | -1.08 |

2.) 1. model  $\approx$  1 prediktorom.  $K \sim N$   $\rightarrow$  neokortex predikuje Kcal

$$K \sim N(\mu, \sigma)$$

$$K_i \sim \text{Normal}(\mu_i, \sigma)$$

$$\mu_i = \alpha + \beta_N N_i$$

$$\alpha + bN / \sigma$$

```
with pm.Model() as m5_5:
    N_mut = pm.Data("N_mut", dcc.N.values)
    sigma = pm.Exponential("sigma", 1)
    bN = pm.Normal("bN", 0, 0.5)
    a = pm.Normal("a", 0, 0.2)
    mu = pm.Deterministic("mu", a + bN * N_mut)
    K = pm.Normal("K", mu, sigma, observed = dcc.K)
    m5_5_trace = pm.sample(random_seed = rng)
```

Prior (zvolané podľa praktických očíkání)

|       | mean  | sd    | hdi_3% | hdi_97% |
|-------|-------|-------|--------|---------|
| a     | 0.038 | 0.160 | -0.264 | 0.337   |
| bN    | 0.130 | 0.238 | -0.304 | 0.601   |
| sigma | 1.128 | 0.204 | 0.795  | 1.538   |

vyzerá to že  $N$  je veľmi slabý na vysvetlenie  $K$

? slabota

$N \propto M / (\text{body mass})$  in log

$\log N \rightarrow K$

$\log M \rightarrow K$

Weak associations

ALONE

takže osobitne nič neukazujú, ale čo ak urobíme multiple regression?

- Unfortunately we cannot decide which one is valid using correlations, as all generate the same conditional independencies.
- They are in the same Markov Equivalence Set
- In the end, it is not the data, but our background scientific knowledge (the big world) that stands for the correctness of these diagrams.
- Still multiple regression shown us that there are correlations from regressors to the target, even though we cannot see whether they are causal.

# Categorical values:

do regresie nejde čísla, ale kategorie mají význam i

Example: Přidáme "Claude" →

```
array(['Ape', 'New World Monkey', 'Old World Monkey', 'Strepsirrhine'],
      dtype=object)
```

mapping

| claude | Claude ID        |
|--------|------------------|
| 0      | Ape              |
| 1      | New World Monkey |
| 2      | Old World Monkey |
| 3      | Strepsirrhine    |

$$K_i \sim \text{Normal}(\mu_i, \sigma)$$

$$\mu_i = \alpha_{\text{claude}[i]}$$

$$\alpha_j = \text{Normal}(0, 0.5) \quad \text{for } j = 1..3$$

$$\sigma \sim \text{Exponential}(1)$$

Každý Claude ID má vlastní prior

→ zjistit či SA K systematically differs between groups

# Contrast plots

- main model = priemni  $\mu$  (clau)

CONTRAST  $\Rightarrow$  vezname posterior rozdial:  $\mu_{ape} - \mu_{New World Monkey}$

Priemer rozdial - 0.47  
(Ape ma viESI k ako NWN)

ale  
nemame istotu  
ze sa skupiny  
liska, lebo  
95% HDI ide

Cet 0

Contrast average Kcal per g of milk for categories Ape and New World Monkey.
